

**A new species, *Bryobrothera tambuyukonensis* (Daltoniaceae, Bryopsida),
from Sabah, Borneo Island**

Abstrak

We report a new species *Bryobrothera tambuyukonensis*, based on the specimens collected in Sabah, Borneo Island. Phylogenetic analyses with plastid (*rps4* and *trnL-F*) and mitochondrial (*nad5*) genes along with a number of morphological features (for example, undulate lamina, oblong-lanceolate leaves with a single strong costa reddish brown in color, and thickwalled and porose laminal cells) confirmed its distinctiveness from *B. crenulata* and also close relationship to the elimbate group comprised of *Adelothecium bogotense* and *Benitotania elimbata*.
