ACKNOWLEDGEMENT

I would like to thank Assoc. Prof. Dr. Jualang Azlan Gansau for his continual support, patience, dedication, and encouragement during the entire course of my project. Much of this work could never have been completed without a great deal of help from him and many people, including Puan Marrylyn Tadi (Tissue culture laboratory), Puan Rosilah Mohd Edrus (Botany laboratory), Puan Radizah Darun (Physiology Laboratory), En. Mohd. Asri Mohd. Suari (Borneo Marine) Cik Henrieta Lydia Lawrence (Borneo Marine), En. Muhammad Tamrin Muhammad Lal (Borneo Marine), Puan Malah Karim (PPI), En. Timani Kumin (PPI), En. Taipin Godoit (Chemistry Laboratory) and many others. Their assistance made many experiments possible.

I also wish to acknowledge the fellow graduate students who I have worked with over the years: Birhalawati Bakar, Gabriella Joepilik, Ozayanna Cyril, Norhaniza Johansah, Sharon Spiridin, Clarice Evey Anjun and Ahmad Asnawi Mus. Work would not been possible without their assistance and their helps in providing the type of insight that only friend and lab-mates can provide.

I thank my mother, Madam Agnes Anthony Tanggang, who supports my educational goals despite not fully understanding what I was doing, and to my late father, Mr. Edward Jainol, who made me the person that I am today; to all my sisters and my brothers for their loves and understandings, also for the financial and moral supports received throughout the years; to my 10-year old daughter, the love of my life, Abigail R. Tramell for her unwavering love, grudging support and immense degree of patience during my work. Without all of them, none of this would have been possible.

Last but not least, I thank my family in Florida and Ohio, USA for being so supportive and understanding. We did it.

Juddy E. Jainol

ABSTRACT

Dimorphorchis lowii with its spectacular dimorphic flowers is well known to orchid enthusiasts. This species belongs to Vandaeae tribe and Aeridinae subtribe. Like most of the other endemic orchids in Borneo island, this species is facing combined threats from habitat loss, habitat degradation, and problems in viable seed production and inefficient conventional vegetative propagation. Therefore *in vitro* propagation offers an important measure for multiplication and conservation of this species. In this study, protocols for *in vitro* propagation of *D. lowii* through semi-solid and liquid systems were developed. The effects of basal media ($\frac{1}{2}$ MS, MS, $\frac{1}{2}$ KC, KC, VW, and Mitra), plant growth regulators (KIN, BAP, TDZ, 2,4-D, NAA, IBA, and IAA), complex additives (banana homogenate, coconut water, tomato juice, peptone, and yeast extract), carbon sources (fructose, glucose, and sucrose), light and dark photoperiods (16-hr light, 24-hr dark, and 24-hr light), and type of leaf segments (leaf tip, middle, and leaf base) on callus induction from leaf explant; protocorm-like-bodies (PLBs) proliferation from callus and shoot development; PLBs proliferation in liquid shake flask culture; shoot multiplication and rooting were investigated. The effect of immersion time on PLB proliferation in temporary immersion bioreactor systems (RITA[®] and twin-flask (BIT[®]) systems was also investigated. Plantlets were subjected to photoautotrophic and photoheterotrophic conditions prior acclimatization process to study their effects on the survival percentage. Callus induction from leaf tip explant was triggered when half-strength MS medium was used as basal medium and cultures were incubated under 24-hr dark photoperiod. However, the percentage of callus formation was very low at only $2.00\% \pm 1.47$. TDZ at 3.0 mg/L with NAA at 0.046 mg/L could increase percentage of callus formation. Sucrose at 2.0% (w/v) showed more favourable result with the callus formation at $42.00\% \pm 9.60$. Leaf tip segment exhibited highest potential in callus formation with the percentage of $50.00\% \pm 20.50$. KC medium was the most suitable for PLB proliferation and development, yielding the highest percentage of survival at $36.00\% \pm 16.52$ and 5.83 ± 1.95 new PLBs per proliferated explant. Number of new PLBs was increased to 8.38 ± 2.45 when 2.0 mg/L TDZ was supplemented in KC medium with $60.00\% \pm 24.47$ PLBs produced shoots. NAA with TDZ at 2.0 mg/L in combination enhanced the number of new PLBs to 10.53 ± 4.50 with $76.00\% \pm 23.14$ PLBs developed shoots. Addition of 15% (v/v) coconut water in KC medium increased the number of new PLBs to 16.88 ± 6.52 and $70.00\% \pm 42.02$ developed shoots. Sucrose at 2.0% (w/v) presented the best results producing 11.55 ± 5.63 new PLBs with $72.00\% \pm 16.20$ produced 10.22 ± 6.17 shoots. The most favourable liquid medium for PLB proliferation in liquid culture system was KC medium with $52.00\% \pm 25.88$ survival. The percentage of survived explants was increased to $96.00\% \pm 5.48$ producing 5.13 ± 1.63 new PLBs when 3.0 mg/L TDZ was supplemented in the medium. Auxin was not suitable for PLBs proliferation when applied alone. Complex additive peptone at 0.2% (w/v) was found to be the best in promoting the formation of new PLB with 11.70 ± 5.01 . PLB proliferation at $86.00\% \pm 10.35$ was obtained when sucrose at 1.0% (w/v) added to the medium. Further study to compare the use of complex additive peptone at 0.2% (w/v) and PGR TDZ at 3.0 mg/L to optimize PLB proliferation under light and dark photoperiod was carried out. Peptone was found to stimulate PLBs proliferation with $84.00\% \pm 37.03$ under 16-hr light photoperiod

but 24-hr light photoperiod was favourable in terms of number of new PLBs produced with 6.92 ± 3.08 per explant. In the temporary immersion bioreactor systems, the RITA[®] system was favourable than the twin-flask (BIT[®]) system by producing $66.00\% \pm 38.15$ of PLB proliferation with 12.56 ± 3.46 new PLBs per proliferated explant when cultures were immersed for 30 min per 6-hr per day. Shoot multiplication was enhanced when 2.0 mg/L KIN was supplemented in the medium, producing 5.05 ± 2.01 shoots per explant. The use of 15% (v/v) coconut water as complex additive promoted multiplication by two-fold producing 13.83 ± 6.12 shoots per explant. Sucrose at 2.0% (w/v) showed favourable result generating 4.03 ± 3.16 shoots per explant. KC medium was found to be the best medium, yielding 4.69 ± 3.93 shoots per explant. Root formation was improved when 1.0 mg/L IAA combined with 0.5 mg/L IBA were supplemented in the medium, producing 1.93 ± 0.96 roots per explant. The use of 15% (v/v) coconut water as complex additive promoted root formation by almost two-fold yielding 3.00 ± 1.44 roots per explant. Glucose at 2.0% (w/v) showed favourable result, producing 1.90 ± 1.14 roots per explant and KC medium was better used as basal medium generating 3.00 ± 1.44 roots per explant. In acclimatization, well-developed rooted plantlets were subjected to photoautotrophic and photoheterotrophic in *in vitro* conditions. After 60 days, plantlets were transferred to the potting mixture containing coco peat, sphagnum moss and charcoal in the ratio of 1:1:1. Higher survival rate of plantlets was obtained in plantlets that were subjected to photoheterotrophic condition with $78.00\% \pm 41.48$ survival percentage after 60 days of acclimatization. It can be concluded that methods for *in vitro* propagation using various explants were successfully developed *via* semi-solid medium. Liquid medium also provided an alternative for PLB proliferation especially in TIBS using RITA system. Therefore *in vitro* propagation can be used as an alternative to propagate *D. lowii* for mass propagation.

ABSTRAK

PEMBANGUNAN PROPAGASI IN VITRO *Dimorphorchis lowii* (ORCHIDACEAE) MELALUI SISTEM MEDIA SEPARA-PEPEJAL DAN MEDIA CECAIR

Dimorphorchis lowii dengan dua jenis bunga yang luar biasa cantiknya digemari ramai oleh para pengemar orchid. Orkid ini termasuk dalam 'tribe' Vandaeae dan 'subtribe' Aeridinae. Sama seperti orkid endemik yang lain yang terdapat di kepulauan Borneo, spesies ini mengalami pelbagai ancaman daripada kehilangan habitat, penyusutan habitat dan masalah di dalam penghasilan biji benih yang berkeupayaan dan pembiakan melalui kaedah propagasi konvensional adalah tidak efisien. Oleh itu, propagasi in vitro menawarkan teknik yang penting untuk penggandaan dan konservasi orkid ini. Di dalam kajian ini, protokol untuk propagasi in vitro orkid *Dimorphorchis lowii* melalui sistem media separa-pepejal dan cecair telah dibangunkan. Kesan media ($\frac{1}{2}$ MS, MS, $\frac{1}{2}$ KC, KC, V&W, dan Mitra), pengawalatur pertumbuhan (KIN, BAP, TDZ, 2,4-D, NAA, IBA, dan IAA), kompleks aditif (air kelapa, jus tomato, homogenat pisang, pepton, dan ekstrak yis), sumber karbon (fruktosa, glukosa, sukrosa), cahaya (16 jam cerah, 24 jam gelap, dan 24 jam cerah), dan jenis segmen eksplan daun (hujung daun, bahagian tengah, bahagian pangkal) terhadap pengaruh kalus dari eksplan daun; proliferasi jasad seperti protokom (JSP) daripada kalus dan perkembangan pucuk; proliferasi JSP di dalam media cecair, penggandaan pucuk, dan pengakaran telah dikaji. Kesan masa rendaman terhadap proliferasi JSP di dalam sistem rendaman sementara (RITA[®] dan flask berkembar atau BIT[®]) juga telah dikaji. Anak pokok dirawat secara fotoautotropik dan fotoheterotropik sebelum proses aklimatisasi untuk mengkaji kesan rawatan in terhadap peratus anak pokok yang hidup. Pengaruh kalus dari daun didapati terbaik dengan penggunaan media MS dengan kepekatan separuh dan kultur di letakkan di dalam gelap 24 jam. Tetapi peratus pengaruh kalus adalah rendah iaitu hanya $2.00\% \pm 1.47$. TDZ dengan kepekatan 3.0 mg/L dan NAA dengan kepekatan 0.046 mg/L, boleh meningkatkan peratus pengaruh kalus. Sukrosa pada kepekatan 2.0% (w/v) didapati lebih berkesan dengan menghasilkan pengaruh kalus sebanyak $42.00\% \pm 9.60$. Hujung daun didapati mempunyai potensi yang tinggi dengan menghasilkan peratus pengaruh sebanyak $50.00\% \pm 20.50$. Media KC didapati paling sesuai untuk proliferasi and perkembangan JSP dengan menghasilkan $36.00\% \pm 16.52$ JSP baharu yang hidup dan 5.83 ± 1.95 JSP baharu per eksplan yang berproliferasi. Bilangan JSP baharu meningkat ke 8.38 ± 2.45 bila 2.0 mg/L TDZ ditambah di dalam media KC dan $60.00\% \pm 24.47$ JSP menghasilkan pucuk. NAA dan TDZ dengan kepekatan 2.0 mg/L didapati dapat mempertingkatkan bilangan JSP baharu sebanyak 10.53 ± 4.50 dengan $76.00\% \pm 23.14$ JSP menghasilkan pucuk. Penambahan 15% (v/v) air kelapa di dalam media juga didapati meningkatkan bilangan JSP baharu sebanyak 16.88 ± 6.52 dengan $70.00\% \pm 42.02$ tumbuh menjadi pucuk. Sukrosa dengan 2.0% (w/v) didapati menghasilkan 11.55 ± 5.63 JSP baharu dengan $72.00\% \pm 16.20$ tumbuh menghasilkan 10.22 ± 6.17 pucuk. Media cecair yang terbaik untuk proliferasi JSP ialah media KC dengan menghasilkan $52.00\% \pm 25.88$ eksplan yang hidup. Peratus eksplan yang hidup ditingkatkan ke $96.00\% \pm 5.48$ dengan penghasilan 5.13 ± 1.63 JSP baharu dengan penambahan 3.0 mg/L TDZ di dalam

media pengkulturan. Auxin secara individu didapati tidak mempengaruhi proliferasi JSP sebaik sitokinin. Kompleks aditif pepton pada kepekatan 0.2% (w/v) pula didapati dapat merangsangkan proliferasi JSP dengan jumlah JSP baharu sebanyak 11.70 ± 5.01 . Proliferasi JSP sebanyak $86.00\% \pm 10.35$ terhasil apabila 1.0% sukrosa (w/v) ditambah di dalam media. Kajian selanjutnya dijalankan untuk membandingkan penggunaan kompleks aditif 0.2% (w/v) pepton dengan pengawatur tumbuhan 3.0 mg/L TDZ dengan cara mengoptimasikan proliferasi JSP di dalam gelap dan cerah. Pepton didapati dapat merangsangkan proliferasi JSP dengan peratusan setinggi $84.00\% \pm 37.03$ di bawah 16 jam cerah sementara itu 24 jam cerah didapati meningkatkan bilangan JSP baharu sebanyak 6.92 ± 3.08 per eksplan. Di dalam kajian sistem rendaman sementara, Sistem RITA[®] adalah lebih baik berbanding dengan sistem flask kembar (BIT[®]). Dengan sistem RITA[®], peratusan proliferasi JSP menjangkau $66.00\% \pm 38.15$ dengan penghasilan 12.56 ± 3.46 JSP baharu per eksplan yang berproliferasi dengan perendaman selama 30 min setiap 6 jam setiap hari. Pengandaan pucuk dapat ditingkatkan dengan penggunaan 2.0 mg/L KIN dengan menghasilkan 5.05 ± 2.01 pucuk per eksplan. Seterusnya dengan penggunaan air kelapa sebanyak 15% (v/v) sebagai kompleks aditif, ianya meningkatkan pengandaan pucuk dua kali ganda dengan penghasilan 13.83 ± 6.12 pucuk per eksplan. Sukrosa dengan 2.0% (w/v) adalah lebih berkesan dengan penghasilan 4.03 ± 3.16 pucuk per eksplan. Media KC didapati adalah yang terbaik dengan menghasilkan 4.69 ± 3.93 pucuk per eksplan. Pembentukan akar telah ditingkatkan dengan penambahan 1.0 mg/L IAA dengan kombinasi 0.5 mg/L IBA di dalam media pengkulturan dan menghasilkan 1.93 ± 0.96 akar per eksplan. Penggunaan air kelapa sebanyak 15% (w/v) sebagai kompleks aditif juga dapat menambahbaik penghasilan akar dua kali ganda dengan menghasilkan 3.00 ± 1.44 akar per eksplan. Glukosa dengan 2% (w/v) didapati lebih baik dengan penghasilan 1.90 ± 1.14 akar per eksplan. Media KC didapati lebih baik sebagai media asas dengan menghasilkan 3.00 ± 1.44 akar per eksplan. Dalam proses aklimatisasi, pucuk yang lengkap dengan akar dirawat dalam keadaan fotoautotropik dan fotoheterotropik selama 60 hari dan kemudian dipindahkan di dalam pasu plastik yang mengandungi tanah gambut, lumut sphagnum dan serpihan arang dengan nisbah 1:1:1. Peratusan anak pokok hidup yang dirawat dalam keadaan fotoheterotropik didapati lebih tinggi iaitu sebanyak $78.00\% \pm 41.48$ dibandingkan dengan anak pokok yang dirawat dalam keadaan fotoautotropik. Sebagai kesimpulannya, kaedah propagasi in vitro dengan menggunakan pelbagai eksplan telah berjaya dibangunkan melalui media separa-pepejal. Media cecair juga boleh digunakan sebagai alternatif untuk proliferasi JSP terutamanya di dalam sistem rendaman sementara dengan menggunakan sistem RITA. Oleh itu, propagasi in vitro boleh digunakan sebagai alternatif untuk propagasi pengandaan orkid *D. lowii*.

Table 4.4 The effect of combination of TDZ and NAA at various concentration on PLB proliferation and shoot development	112

from callus of *D. lowii* cultured on KC medium supplemented with 2.0% (w/v) sucrose under 24-hour light photoperiod with PFD of 15-25 $\mu\text{molm}^{-2}\text{s}^{-1}$ at $25\pm 2^\circ\text{C}$ after 60 and 120 days of culture (DOC).

Table 4.5	The effect of carbon source type and concentration on PLBs proliferation and shoot development from callus culture of <i>D. lowii</i> on KC medium supplemented with 15% v/v coconut water under 24-hour light photoperiod with PFD of 15-25 $\mu\text{molm}^{-2}\text{s}^{-1}$ at $25\pm 2^\circ\text{C}$ after 60 and 120 days of culture.	116
Table 5.1	The effect of basal medium type and strength on explant survival cultured in medium supplemented with 2.0% (w/v) sucrose, incubated on orbital shaker for 24-hours at 100 rpm under 24-hour light photoperiod with PFD of 15-25 $\mu\text{molm}^{-2}\text{s}^{-1}$ at $25 \pm 2^\circ\text{C}$ after 60 days of culture.	134
Table 5.2	The effect of plant growth regulator (cytokinin) types and concentrations on PLB proliferation cultured in KC medium supplemented with 2.0% (w/v) sucrose, incubated on orbital shaker for 24-hours at 100 rpm with 24-hour dark at $25 \pm 2^\circ\text{C}$ after 60 days of culture.	139
Table 5.3	The effect of plant growth regulator (auxin) types and concentrations on PLB proliferation cultured in liquid KC medium supplemented with 2.0% (w/v) sucrose, incubated on orbital shaker for 24-hours at 100 rpm under 24-hour dark photoperiod at $25 \pm 2^\circ\text{C}$ after 60 days of culture.	142
Table 5.4	The effect of complex additives types and concentrations on PLB proliferation cultured in liquid KC medium supplemented with 2% (w/v) sucrose, incubated on orbital shaker for 24-hours at 100 rpm with 24-hour light photoperiod, PFD of 15-25 $\mu\text{molm}^{-2}\text{s}^{-1}$ at $25 \pm 2^\circ\text{C}$ after 60 days of culture.	146
Table 5.5	The effect of carbon source types and concentrations on PLB proliferation cultured in liquid KC medium supplemented with 0.2% (w/v) peptone incubated on orbital shaker for 24-hours at 100 rpm with 24-hour light photoperiod, PFD of 15-25 $\mu\text{molm}^{-2}\text{s}^{-1}$ at $25\pm 2^\circ\text{C}$ after 60 days of culture.	151
Table 5.6	The effect of complex additive 0.2% w/v peptone and cytokinin 3.0 mg/l TDZ on PLB proliferation cultured in liquid KC medium supplemented with 1.0% (w/v) sucrose, incubated on orbital shaker for 24-hours at 100 rpm at $25 \pm 2^\circ\text{C}$ after 60 days of culture.	157
Table 6.1	The effect of different immersion frequency on <i>D. lowii</i> PLBs proliferation cultured in twin-flask and RITA temporary immersion bioreactor systems using liquid KC medium supplemented with 0.2% (w/v) peptone with 2.0% (w/v) sucrose incubated under 24-hour light photoperiod with PFD of 15-25 $\mu\text{molm}^{-2}\text{s}^{-1}$ at $25\pm 2^\circ\text{C}$ after 60 days of culture.	179

Table 7.1	The effect of complex additive on shoot multiplication of <i>Dimorphorchis lowii</i> cultured in KC medium under 24-hour light photoperiod with PFD of 15-25 $\mu\text{molm}^{-2}\text{s}^{-1}$ and temperature of $25\pm 2^{\circ}\text{C}$ after 180 days of culture.	195
Table 7.2	The effect of PGR cytokinin on shoot multiplication of <i>Dimorphorchis lowii</i> cultured horizontally (H) and vertically (V) under 24-hour light photoperiod with PFD of 15-25 $\mu\text{molm}^{-2}\text{s}^{-1}$ and temperature of $25\pm 2^{\circ}\text{C}$ after 180 days of culture.	202
Table 7.3	The effect of carbon sources on shoot multiplication of <i>Dimorphorchis lowii</i> cultured horizontally in KC medium supplemented with 15% (v/v) coconut water incubated under 24-hour light photoperiod with PFD of 15-25 $\mu\text{molm}^{-2}\text{s}^{-1}$ and temperature of $25\pm 2^{\circ}\text{C}$ after 180 days of culture.	209
Table 7.4	The effect of basal medium type and strength on shoot multiplication of <i>Dimorphorchis lowii</i> cultured horizontally in medium supplemented with 2.0% (w/v) sucrose under 24-hour light photoperiod with PFD of 15-25 $\mu\text{molm}^{-2}\text{s}^{-1}$ and temperature of $25\pm 2^{\circ}\text{C}$ after 180 days of culture.	214
Table 8.1:	The effect of complex additives on root formation of <i>D. lowii</i> shoot tip cultured on KC medium supplemented with 2.0% (w/v) sucrose under 24-hour light photoperiod with PFD of 15-25 $\mu\text{molm}^{-2}\text{s}^{-1}$ and temperature of $25\pm 2^{\circ}\text{C}$ after 120 days of culture.	225
Table 8.2:	The effect of IAA, IBA and NAA on root formation of <i>D. lowii</i> shoot tip explants cultured on KC medium supplemented with 2.0% (w/v) sucrose under 24-hour light photoperiod with PFD of 15-25 $\mu\text{molm}^{-2}\text{s}^{-1}$ and temperature of $25\pm 2^{\circ}\text{C}$ after 120 days of culture.	231
Table 8.3:	The effect of combination of auxins IAA, IBA and NAA on root formation of <i>D. lowii</i> shoot tip explants cultured in KC medium under 24-hour light photoperiod with PFD of 15-25 $\mu\text{molm}^{-2}\text{s}^{-1}$ and temperature of $25\pm 2^{\circ}\text{C}$ after 120 days of culture.	232
Table 8.4:	The effect of carbon sources on root formation of <i>D. lowii</i> shoot tip cultured in KC medium supplemented with 15% (v/v) coconut water under 24-hour light photoperiod with PFD of 15-25 $\mu\text{molm}^{-2}\text{s}^{-1}$ and temperature of $25\pm 2^{\circ}\text{C}$ after 120 days of culture.	237
Table 8.5:	The effect of basal medium type and strength on root formation of <i>D. lowii</i> shoot tip cultured in KC medium supplemented with 15% (v/v) coconut water and 1.0% (w/v) sucrose under 24-hour light photoperiod with PFD of 15-25 $\mu\text{molm}^{-2}\text{s}^{-1}$ and temperature of $25\pm 2^{\circ}\text{C}$ after 120 days of culture.	243

Table 9.1: The effect of photon flux density (PFD $\mu\text{mol m}^{-2}\text{s}^{-1}$) and medium type on the growth of plantlet after 60 days of acclimatization process in the glass house using substrate of sphagnum moss, coco peat and charcoal chips with the ratio of 1:1:1 maintained in the laboratory for the first 30 days.

LIST OF ABBREVIATIONS AND SYMBOLS

<	Less than
±	Plus minus
½ X	Half concentration
°C	Degree celcius
μM	Micromolar
μmolm ⁻² s ⁻¹	Micromol per meter square per second
2, 4-D	2,4-dichlorophenoxyacetic acid
ANOVA	Analysis of variance
AP2/ERF	Apetala 2/ethylene-responsive element binding factor
AUX1	Auxin influx
BAP	6-benzylaminopurine
Ca	Calcium
CKX	Cytokinin oxidase gene
Co	Cobalt
CRD	Complete randomized design
Cu	Copper
DAC	Day after culture
DMRT	Duncan Multiple Range Test
DNA	Deoxyribonucleic acid
DNSO	De novo shoot organogenesis
DSCKX1	<i>Dendrobium sonia</i> cytokinin oxidase gene
Fe	Ferum (Iron)
GA	Gibberellic acid
HCl	Hydrochloric acid
IAA	Indole-3-acetic acid
IBA	Indole-3-butyric acid
K	Potassium
KC	Knudson C medium
KIN	6-furfurylaminopurine
Lux	Lumen per meter squared
Mg	Magnesium
Mn	Manganese
Mo	Molybdate
Mpa	MegaPascal
MS	Murashige and Skoog medium
M	Molar
mm	Millimeter
mg/l	Milligram per liter
N	Nitrogen
NAA	α-Naphtaleneacetic acid
NaOH	Sodium hydroxide
P	Phosphorus
Psi	Pounds/square inch
PFD	Photon flux densities
PGRs	Plant growth regulators
PIN	Pin-formed protein
PLBs	Protocorm like bodies
