

A new cembrane diterpene from the Bornean soft coral *Nephthea* sp.

Abstract

A new cembrane diterpene, 6-acetoxy-7,8-epoxynephtenol acetate (1) was isolated along with a known compound, epoxynephtenol acetate (2), from the organic extract of a Bornean soft coral *Nephthea* sp. Their structures were elucidated on the basis of spectroscopic analyses and comparison with those previous literature data.
