

## **Saurauia speciosa**

### **ABSTRACT**

*Saurauia speciosa* is endemic to Sabah where it is relatively widespread. The estimated area of occupancy (AOO) and extent of occurrence (EOO) are 48 km<sup>2</sup> and 22,858 km<sup>2</sup>, respectively. As it is a lowland species, it is threatened by land use change, leading to an estimated decline of 50% in AOO and 4% in EOO. It is found in 11 locations, all of which are within Totally Protected Areas (TPAs) but potential disturbance is still a threat to each locality. It has an ability to adapt to secondary forests and different soil type. It is assessed as Near Threatened nearly meeting threatened category under criterion B. *Saurauia speciosa* is endemic to Sabah, Malaysia. It is restricted to west and east Sabah.
