## ACKNOWLEDGEMENTS

First and foremost, I will thank Lord, the Almighty Father, being so compassionate and merciful has kindly helped me to complete my thesis. I truly believe my courage and energy for undertaking as well as completing my Ph.D successfully was only possible due to the Glory of God.

The success of this thesis is attributed to the extensive support and assistance from my supervisors, Associate Professor Dr. Tan Choon Keong, Professor Dr. Vincent Pang and Dr. Sporty Chin. With that, I would like to express my most grateful gratitude and sincere appreciation to all of them for their guidance, valuable advice, supervision, encouragement and kindness to me throughout this study.

First of all, I would like to thank Associate Professor Dr. Tan Choon Keong, my main supervisor for he has set high expectations for me to meet and challenged me to be an independent thinker. His constructive criticisms were always timely and helpful in the write up of my research methodology.

I would like to thank Professor Dr. Vincent Pang for patiently led me through a rather complex quantitative analysis using the Rasch Model. I really appreciate very much his effort of organising and inviting me twice to a short course on Rasch Model – absolutely free of charge. Thank you also for the prompt feedbacks, editing and proof reading of my thesis and articles written for publications.

I would like thank Dr. Sporty Chin, whom I met in 2012 for spending quality time, sharing ideas on basic mathematics operations, introducing me to David Tall's (his Ph.D supervisor at the University of Warwick, U.K.) webpage and guiding me through the qualitative analysis. Thank you so much for graciously helping me to obtain articles from journals during his study in the U.K. which I couldn't access from here.

My sincere thanks to the external examiner, Associate Professor Dr. Chew Cheng Meng as well as to both of my internal examiners, Associate Professor Dr. Mohd. Zaki bin Ishak and Dr. Siew Nyet Moi @ Sopiah Abdullah for their remarkable views, comments and suggestions that have further improved the overall flow of ideas throughout the five chapters.

I would like to express my special thanks to Dr. Patrick Barmby, who is presently working as a Senior Lecturer in Mathematics Education at University of the Witwatersrand (formerly at University of Durham, U.K.) for sharing ideas on primary mathematics, focusing in array representation. My most sincere thanks also goes to Associate Professor Dr. Ho Chong Mun, an expert in recreational mathematics working at Universiti Malaysia Sabah for his kind contributions to further improve my research tools. Thank you very much to both of you for validating my tools and the test.

A special thank you I wish to the Heads; especially Datin Hajah Florence Faizah Kouju, teachers and students of all the primary schools for the fullest cooperation given to me throughout the interventions during the pilot and main study. I am truly also indebted to a group of my undergraduates students for helping me in the collection of test data from eight primary schools in the district of Tawau during the pilot study. Thank you very much to my ex-student, Miss Lim Ai Teng for preparing the devices for audio- and video-recordings and helping in the collection and transcription of the audiovisual data during the main study. I am forever grateful to all the wonderful and cheerful students (in the pilot and main study) for their active participations and sincere cooperation given to me.

Last but not least, to my family, especially my husband, daughter, son, mother, father, sisters, brother, nieces and nephews as well as to all my friends, especially Noraini Said, Idarmawati Ahmad and Israh Ariffin and every other people who are not listed above, thank you so much for their unwavering support, continuous encouragement, consistent prayers and great patience throughout my long journey towards the successful completion of my study. They have made my Ph.D process a pleasure of learning and gaining more knowledge.

## ABSTRACT

This study aims to examine how Line Array Representation can support primary school students' understanding in single digit multiplication (SDM) and multi-digit multiplication (MDM) whole number calculations among Year 3 and Year 5 students as well as to determine its effect on the students' understanding of whole number multiplication through a multiplication test for each level constructed based on the range of calculation strategies associated with multiplication. A theoretical framework in mathematical growth which connects between the embodiment and symbolism domains was developed to examine the understanding in multiplication. The construction of multiplication concept can be examined through whether student is able to perceive, act and reason upon the line array that is considered to be the key representation for multiplication in this study. Having established the theoretical framework, the research design consists of a mixed methods approach was drawn up to conduct a qualitative study in the first phase and followed by a quantitative study in the second phase. The design is based on 'QUAL → quan Sequential Exploratory Design' which has given priority to the qualitative aspect of the study. The participants of this study were taken from an intact class of 29 Year 3 (15 boys, 14 girls) and 32 Year 5 (19 boys, 13 girls). Year 5 data was collected during an intervention in early February to mid-March 2014 while Year 3 data in mid-March to end of April 2014. Qualitative data was collected by using the teaching experiment technique. Students worked in pairs on ten SDM and two MDM tasks. Analysis of the obtained audio- and video-recordings, written tasks and field notes had identified strategies in which the Line Array Representation supported or hindered students' multiplication calculations. Results showed that students were able to apply the commutative and distributive over addition property to solve multiplication problem, most evident in 2-digit by 2-digit multiplication. Using line array, students were capable of inventing own procedures, solving MDM from the left to the right (thousands, hundreds, tens and units) obviously opposes the traditional algorithm of working from right to left. The quantitative data was collected from the 33-item multiplication test which was administered to each student before and after the intervention. The data obtained from the tests were subjected to Rasch analysis using Quest software. Overall, the resulting measures have shown to have good reliability as indicated by a Cronbach's alpha value of 0.79 for Year 3 and 0.82 for Year 5. The higher mean person estimates (Year 3 = +0.27 logits and Year 5 = +0.98 logits) compared with the mean item threshold defaulted at 0.00 logit showed that items were likely well matched for Year 3 students and easy for Year 5 students. Problems that students had faced with using the array and dilemmas that researcher encountered throughout the study are discussed. Based on these findings, two implications of this study are (1) pedagogical use of visual representations by teachers and (2) the benefits of using Item-Response Theory (IRT) model by teachers in assessments. Recommendations for further improvements in the test, structure of the line array and a different method of data collection are also put forward.

## **ABSTRAK**

### **MENGGUNAKAN PERWAKILAN SUSUNAN GARISAN SEBAGAI KAEDAH ALTERNATIF DALAM KEFAHAMAN PENDARABAN NOMBOR BULAT DALAM KALANGAN MURID SEKOLAH RENDAH**

*Kajian ini bertujuan untuk meneliti bagaimana perwakilan susunan garisan boleh menyokong murid dalam pendaraban nombor bulat satu digit dengan satu digit (SDM) dan pendaraban berbilang digit (MDM) murid Tahun 3 dan Tahun 5 serta untuk menentukan kesannya terhadap kefahaman murid tersebut tentang pendaraban nombor bulat melalui ujian Pendaraban yang dibina bagi setiap tahap berdasarkan pelbagai strategi pengiraan yang berkaitan dengan pendaraban. Dengan mengadaptasikan kerangka teori yang melibatkan perkembangan matematik, kefahaman konsep pendaraban bagi murid sekolah rendah dapat dilihat sebagai persilangan di antara domain penjelmaan dan simbolisme dan di mana strategi pengiraan pendaraban akan muncul di dalam persilangan kedua-dua domain tersebut. Pembinaan konsep pendaraban boleh dikaji melalui sama ada murid dapat melihat, bertindak dan menaakul; perwakilan susunan garisan yang dianggap sebagai perwakilan utama bagi pendaraban dalam kajian ini. Setelah mengukuhkan kerangka teori, rekabentuk penyelidikan yang terdiri daripada pendekatan kaedah gabungan digunakan untuk menjalankan satu kajian kualitatif dalam fasa pertama dan diikuti oleh kajian kuantitatif dalam fasa kedua. Rekabentuk kajian adalah berdasarkan rekabentuk eksploratori bersiri 'QUAL►quan' di mana keutamaan analisis data diberi kepada aspek kualitatif dalam kajian ini. Peserta kajian ini terdiri daripada satu kelas Tahun 3 seramai 29 orang (15 lelaki, 14 perempuan) dan satu kelas Tahun 5 seramai 32 orang murid (19 lelaki, 13 perempuan), di mana tahap kebolehan murid telah dibahagikan kepada tiga tahap yang berbeza; tinggi, sederhana dan rendah. Data Tahun 5 dikumpul dari awal Februari hingga pertengahan Mac 2014 manakala data Tahun 3 dari pertengahan Mac hingga akhir April 2014 melalui intervensi seperti yang dirancang. Data kualitatif dikumpul dengan menggunakan teknik Eksperimen Pengajaran, di mana murid secara berpasangan menyelesaikan tugas yang terdiri sepuluh sepuluh SDM dan dua MDM tugas dalam lembaran kerja yang disediakan. Analisis daripada data kualitatif yang diperolehi secara audiovisual dan bertulis telah mengenalpasti beberapa strategi yang digunakan oleh murid menunjukkan perwakilan susunan garisan dapat menyokong murid dalam pengiraan pendaraban. Dapatan kajian menunjukkan bahawa murid mampu mengaplikasikan Hukum Tukar Tertib dan Taburan dalam penambahan untuk menyelesaikan masalah pendaraban, paling ketara ditunjukkan dalam pendaraban 2-digit dengan 2-digit. Menggunakan perwakilan garisan tersebut, murid berupaya mencipta prosedur terutama dalam menyelesaikan MDM, iaitu mengira dari kiri ke kanan (ribu, ratus, puluh dan sa). Cara pengiraan ini jelas menunjukkan ia bertentang dengan algoritma yang tradisional, iaitu bekerja dari kanan ke kiri. Data kuantitatif pula dikutip daripada skor ujian pendaraban yang terdiri daripada 33 item telah ditadbirkan kepada setiap murid sebelum dan selepas intervensi. Data yang diperolehi daripada ujian-ujian tersebut telah dianalisis dengan menggunakan analisis Rasch, perisian Quest. Secara keseluruhan, dapatan kajian menunjukkan*

*kebolehpercayaan item yang baik, di mana nilai alfa Cronbach adalah 0.79 untuk Tahun 3 dan 0.82 untuk Tahun 5. Min anggaran kebolehan murid yang lebih tinggi (Tahun 3 = +0.27logits dan Tahun 5 = +0.98 logits) berbanding dengan min item (0.00 logit) menunjukkan kemungkinan bahawa item-item adalah berpadanan dengan tahap kebolehan murid Tahun 3 manakala agak mudah untuk murid Tahun 5. Tambahan pula, semua peta 'Item-fit' untuk Tahun 3 (kecuali 3 item) and Tahun 5 menunjukkan semua item adalah 'fit' dalam julat 0.7 ke 1.3. Kajian ini membincangkan masalah yang telah dihadapi oleh murid semasa menggunakan perwakilan susunan garisan dan dilema yang dihadapi oleh penyelidik semasa melaksanakan kajian. Berdasarkan dapatan kajian ini, terdapat dua implikasi utama iaitu (1) menggunakan perwakilan secara visual dalam pedagogi oleh guru-guru dan (2) faedah-faedah menggunakan model Item-Response Theory (IRT) oleh guru-guru dalam penilaian. Cadangan-cadangan untuk penambahbaikan item dalam ujian, struktur perwakilan susunan garisan dan cara mengutip data yang berlainan juga telah dikemukakan.*

Figure 4.26:	Drawings showing S2 for 12x3 from $bc_1$ pair	128
Figure 4.27:	Drawings showing S2 for 11x2 from $BB_1$ pair	128
Figure 4.28:	Drawings showing S3i for 12x3 from $gA_1$ pair	129
Figure 4.29:	Drawing showing S3i for 13x12 from $gB_1$ pair	130
Figure 4.30:	Drawings showing S3ii for 56x7 from $gA_1$ pair	131
Figure 4.31:	Drawings showing S3ii for 56x7 from $BC_2$ pair	132
Figure 4.32:	Drawings showing S3ii for 56x7 from $BB_1$ pair	133
Figure 4.33:	Drawings showing S3ii for 56x7 from $gB_2$ pair	134
Figure 4.34:	A summary of various drawings showing S3ii for 56x7 of Year 3 and Year 5 students	135
Figure 4.35:	Drawings showing S3iii for 56x43 from $BB_1$ pair	136
Figure 4.36:	Drawings showing S3iii for 24x18 from $GB_1$ pair	137
Figure 4.37:	Over-reliant of S1 leading to inaccurate answer for 9x9 from $gC_1$ pair	140

Figure 4.38:	Over-reliant of S1 leading to no answer for 56x7 from bC <sub>2</sub> pair	140
Figure 4.39:	Over-reliant of S1 leading to incorrect answer for 13x12 from bB <sub>1</sub> pair	141
Figure 4.40:	Over-reliant of S1 leading to confusions for MDM	141
Figure 4.41:	Disconnection between line array drawings and multiplication symbols from BB <sub>1</sub> pair	142
Figure 4.42:	Line array diagram not connected with multiplication symbols from gC <sub>2</sub> pair	143
Figure 4.43:	Problematic previous knowledge relating to memory retrieval from GC <sub>2</sub> pair	143
Figure 4.44:	Poor previous experience in addition from gB <sub>1</sub> pair	144
Figure 4.45:	Comparing Year 3 students distributions between pre- and post-test with 30 items anchored	149
Figure 4.46:	Item-person map of Year 3 students' post-test	152
Figure 4.47:	Comparing Year 5 student distributions between pre- and post-test with 33 items anchored	155
Figure 4.48:	Item-person map of Year 5 students in post-test	157
Figure 5.1:	Using concrete plastic sticks to show 10x1 by applying the principle of 'stacking'	164
Figure 5.2:	Learning multiplication through perception, action and reason using Line Array Representation to develop multiplication calculation strategies	166
Figure 5.3:	Theoretical framework for understanding SDM and MDM using Line Array Representation	167
Figure 5.4:	Kidmap for Year 3 girl (gA08) showing good fit to mode (Infit MNSQ= 0.95)	169
Figure 5.5:	Kidmap for Year 3 boy (bB18) student showing inadequate fit to model (Infit MNSQ = +1.63)	170
Figure 5.6:	Kidmap for Year 3 girl (gB03) student showing inadequate fit to model (Infit MNSQ = +1.43)	172

Figure 5.7:	Students' abilities and item difficulties from a cross-section of Year 5 IPM	176
Figure 5.8:	Modified line array diagram of mental multiplication for MDM without regrouping: $22 \times 13$	183
Figure 5.9:	Modified line array diagram of mental multiplication for MDM with regrouping: $246 \times 32$	183
Figure 5.10:	Modified line array diagram of mental multiplication for MDM with regrouping: $2.46 \times 3.2$	184

## LIST OF SYMBOLS / ABBREVIATIONS

<b>es</b>	effect size
<b>EPPRD</b>	Education Policy Planning and Research Division
<b>H</b>	Hundreds
<b>HOTS</b>	Higher Order Thinking Skills
<b>Infit MNSQ</b>	Infit Mean Square
<b>IRT</b>	Item-Response Theory
<b>IPM</b>	Item-Person Map
<b>IPMs</b>	Item-Person Maps
<b>IU</b>	Instrumental Understanding
<b>JPNS</b>	Sabah State Education Department
<b>KBSR</b>	Kurikulum Bersepadu Sekolah Rendah
<b>KPM</b>	Kementerian Pendidikan Malaysia
<b>KSSR</b>	Kurikulum Standard Sekolah Rendah
<b>LOTS</b>	Lower Order Thinking Skills
<b>MDM</b>	Multi-Digit Multiplication
<b>MOE</b>	Ministry Of Education
<b>MMR</b>	Mixed Methods Research
<b>Outfit MNSQ</b>	Outfit Mean Square
<b>RU</b>	Relational Understanding
<b>SDM</b>	Single Digit Multiplication
<b>T</b>	Tens
<b>Th</b>	Thousands
<b>U</b>	Units / ones
<b>2D x 1D numbers</b>	multiplication of 2-digit with 1-digit whole numbers
<b>2D x 2D numbers</b>	multiplication of 2-digit with 2-digit whole numbers

## LIST OF APPENDICES

	Page
APPENDIX A: Ujian Kemasukan Matematik Tahun 3	203
APPENDIX B: Year 5 Entrance Mathematics Test	206
APPENDIX C: Ujian Pendaraban Tahun 3	209
APPENDIX D: Year 5 Multiplication Test	216
APPENDIX E: Letter of permission to conduct the study byEPRD	223
APPENDIX F: Letter of permission to conduct the study by JPNS	226
APPENDIX G: Expert Validation Form from Dr. Patrick Barmby, University of Durham, U.K.	227
APPENDIX H: Expert Validation Form from Associate Professor Dr. Ho Chong Mun, Universiti Malaysia Sabah	228
APPENDIX I: Item Person Map in the pilot study	229
APPENDIX J: Item fit analysis in the pilot study	230
APPENDIX K: Person estimates in the pilot study	231
APPENDIX L: Year 3 person estimates in the pre-test	232
APPENDIX M: Year 3 person estimates in the post-test	234
APPENDIX N: Year 3 Item-Person Map in the pre-test	236
APPENDIX O: Year 3 Item-Person Map in the post-test	238
APPENDIX P: Year 3 person estimates grouped in three ability levels (Grade A, B and C)	240
APPENDIX Q: Year 5 person estimates in pre-test	246
APPENDIX R: Year 5 person estimates in the post-test	248
APPENDIX S: Year 5 Item-Person Map in the pre-test	250
APPENDIX T: Year 5 Item-Person Map in the post-test	251
APPENDIX U: Year 5 person estimates grouped in three ability levels (Grade A, B and C)	252
APPENDIX V: Samples of audio-recordings and data analysis matrix	258
