ACKNOWLEDGEMENT

First and foremost, I would like to start by thanking Allah the Almighty for His never-ending grace, mercy, provision and wisdom bestowed upon me to finish this research. Next, this thesis would not be possible without helps and cooperation from everyone, including supervisor, lecturers, family, and friends. The acknowledgement is expressed toward advisors and contributors:

I would like to express my deep gratitude and appreciation to my main supervisor, Prof. Ir. Dr. Abdul Karim Bin Mirasa and my co-supervisor Dr. Hidayati Bte Asrah for their most enthusiastic encouragement, useful critiques, and guideline throughout my research study. Advice given by them has been a great help in completing this research. All their knowledge and experienced shared to me helping me understand the problem statement, objective, significant of research and scope of work in my research.

I would also like to thank *Skim Bantuan Pasca Siswazah* for the scholarship, Ministry of Higher Education Malaysia research grant (LRGS 0008-2017) and Universiti Malaysia Sabah, UMSGREAT, Grant no. GUG0394-2/2019 for their financial support, as well as EcoOils Sdn. Bhd. for providing the Eco-Processed Pozzolan used in this research.

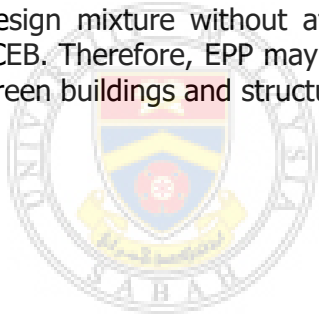

My gratitude is extended to all the technical staff especially Mr. Afflizailizam B. Ali Hassan who always helping me regarding the laboratory work. To the best teammates I could ever ask for, which is Nurul Shahadahtul Afizah Binti Asman, Yvonne William Tonduba, Eddy Syaizul Rizam Bin Abdullah and Raihana Farahiyah Abd Rahman, thank you for always encouraging me to keep going, always asking if I was fine, and for all the potluck time whenever we felt exhausted, happy, or just to meet for a quick catch up. I will forever be grateful for all of it. Thank you for everything.

To my mother and my siblings, thank you for never doubt me and never fail to support my dream. Finally, I would also like to extend my thanks to all my friends for continuously supporting me and were always willing to help me.

Amira Binti Ameer

ABSTRACT

Housing price in Malaysia is unaffordable for most middle to lower income citizens. This is due to, Malaysia has been using massive amount of conventional construction materials such as concrete, fired earth bricks and cement-based bricks, which are expensive and hazardous to the environment. The Interlocking Compressed Earth Brick (ICEB) has been proved to have numerous advantages over the conventional method, including the ability to reduce overall building construction costs. The ICEB is the mixture of soil, sand, water and stabilizer such as cement. Agricultural by-products such as Eco-Processed Pozzolan (EPP) can be used to partially replace cement percentages in ICEB. However, the optimum design and the effect of EPP on ICEB's strength and durability are unknown. Therefore, this study was conducted to establish the optimum mix design of ICEB units using 10%, 20%, 30%, 40% and 50% EPP as partial cement replacement based on compressive strength. In addition, determination of water absorption, porosity, crystallographic as well as the morphology of ICEB units has been carried out to study the effect of EPP towards the durability properties of the ICEB units in terms of water absorption and porosity. Based on the laboratory test results, 20% of EPP as partial cement replacement with 16% water absorption and 31% porosity is chosen as an optimal replacement level because it uses high amount of EPP in design mixture without affecting the compressive strength and durability of the ICEB. Therefore, EPP may be recommended as an admixture in the construction of green buildings and structures in the future.

ABSTRAK

KESAN ECO PROCESSED POZZOLAN SEBAGAI GANTIAN SEPARA SIMEN PADA SIFAT BATA MAMPAT SALING MENGUNCI

Harga rumah di Malaysia tidak mampu dimiliki bagi sesetengah rakyat yang berpendapatan rendah dan sederhana. Ini kerana, Malaysia menggunakan sejumlah besar bahan binaan konvensional seperti konkrit, bata tanah yang di bakar dan batu bata berasaskan simen, yang mahal dan merbahaya kepada alam sekitar. Bata mampat saling mengunci telah terbukti mempunyai banyak kelebihan berbanding kaedah konvensional, termasuk kemampuan untuk mengurangkan kos keseluruhan pembinaan bangunan. Bata mampat saling mengunci terdiri daripada campuran tanah, pasir, air dan penstabil seperti simen. Sisa agrikultur seperti Eco-Processed Pozzolan (EPP) dapat digunakan untuk mengganti sebahagian peratusan simen di dalam bata mampat saling mengunci. Walau bagaimanapun, reka bentuk optimum dan kesan EPP terhadap kekuatan dan ketahanan bata mampat saling mengunci tidak diketahui. Oleh itu, kajian ini dilakukan untuk menetapkan reka bentuk campuran optimum bagi unit bata mampat saling mengunci dengan menggunakan 10%, 20%, 30%, 40% dan 50% EPP sebagai gantian separa simen berdasarkan kekuatan mampatan. Disamping itu, penentuan penyerapan air, keliangan, kristalografi dan juga morfologi bagi unit bata mampat saling mengunci telah dilakukan untuk mengkaji pengaruh EPP terhadap ketahanan unit bata mampat saling mengunci. Berdasarkan hasil ujian makmal, 20% EPP sebagai gantian separa simen dengan 16% penyerapan air dan 31% keliangan dipilih sebagai tahap penggantian yang optimum kerana ia menggunakan jumlah EPP yang tinggi di dalam reka bentuk campuran tanpa menjejaskan kekuatan mampatan dan ketahanan ICEB. Oleh itu, EPP boleh disarankan sebagai campuran dalam pembinaan bangunan dan struktur hijau di masa depan.

CHAPTER 1

INTRODUCTION

1.1 Background of Study

Global housing demand increase rapidly over the past decade resulting an escalation in housing affordability crisis particularly in the cities where economy has grown at a healthy pace and prevailing (O'Dea, 2019). Although housing is the most basic needs of the population worldwide, several country are facing same major challenges where most of their citizen who earn stable income are still unable to buy or rent affordable house (Menon *et al.*, 2019). This is due to house affordability not only revolved around the cost of construction and development, it also includes the operation and maintenance costs as well as accessibility of work and social infrastructure. Therefore, as the housing price continuous to increase in conjunction with the rapid economic growth, and the fact that middle-income households struggling to own their affordable house around the world including Malaysia itself, the first attempted by public sector to develop rural public Low Cost Housing (LCH) programmes in Malaysia was launched in 1950 by the Housing Trust that represented the Federal Government (Sulaiman *et al.*, 2005).

Malaysia's government then announced the initiative towards the LCH which was introduced during the First Malaysian Plan (1966-1970), whereas the Second Malaysia Plan (1971-1975) witnesses the private sectors actively involved in various housing programmes in Malaysia to promote the welfare for lower income groups (Zainon *et al.*, 2017) due to the inability of the government to provide adequate LCH for the citizens (Mohd Arshad & Ku Hassan, 2015). The Fourth Malaysia Plan (1981-1985) introduced a formal guideline for LCH and the government has ensured that every five (5) years, a development plan must continuously emphasise the development of LCH for lower income groups (Sulaiman *et al.*, 2005). While
