## ACKNOWLEDGEMENT

First and foremost, I would like to express my gratitude and appreciation to my supervisors, Dr Wan Khairul Muzammil bin Abdul Rahim and Ir Dr Mohd. Azlan bin Ismail for their continuous support, guidance, patience, and motivational advice while completing this thesis. Dr Wan has consistently pushed me over my comfort zone and has shown me the meaning of 'learning' to a great extent. Whereas Dr Azlan demonstrated that multitasking is not simple, it is nevertheless possible.

I want to extend my gratefulness to Sabah's state government for sponsoring my study through *Biasiswa Kerajaan Negeri Sabah* (BKNS). Besides, I would like to acknowledge Universiti Malaysia Sabah for the research grant allocated (SDK0121-2019) to fund the solar photovoltaic project. These financial aids mean so much to me.

The most profound thanks and appreciations are to my family, especially both of my parents, for the financial help and the endless moral support I receive during the completion of this thesis and my ups and down throughout the years. For my siblings, Ben, Nyna, Ijan, and Ewa, thank you for keeping me close to your heart and always wishing me success. Indubitably, I would do the same for you. Next, a special thanks to my other half, VTKS, for his compassion, understanding, and undivided attention. I believe his daily good morning speech has always contributed to my perseverance.

Finally, I would like to give immeasurable thanks to all my friends who helped and supported me throughout this project. Your support has given me significant advantages and motivated me as I work towards completing this thesis. Only God could repay all your generosity. So once again, thank you so much for everything.

Maryon Eliza Matius

## ABSTRACT

In search of a clean energy resource for a better environment and a 100% electrification rate, Malaysia has set a target to achieve 31% renewable energy contribution by 2025. However, in rural areas of Malaysia, especially Sabah and Sarawak, more than 50% of the population is below the poverty line as of 2017. To overcome these problems, this research intends to help in promoting renewable energy technology as a sustainable electricity generation mechanism, especially in rural areas where the national grid is not cost-effective due to challenging terrain in certain regions. The Eco-Tourism Destination of Liogu Ku Silou-Silou (EPLISSI), Kota Belud, Sabah, has been selected as the study site. This study aims to develop a small-scale off-grid solar PV system, analyze its performance, and find the most optimized design through simulation studies. Meanwhile, the method used to achieve the aims of this research includes the preliminary assessment, design development through the review of the past studies as well as computation and components' selection, components' fabrication and testing, and installation of the system and measuring devices. As for the simulation studies, the ESCoBox tool, Global Solar Atlas version 2.3 (GSA 2.3), and HOMER software were used. The ESCoBox and GSA 2.3 softwares were used in the preliminary study (i.e., before the photovoltaic (PV) system installation) to generate the load profiles, and to select the approximate size of the PV panel system, respectively. While the HOMER software optimises the system (post PV system installation) on the existing system. As a result, it is found that the EPLISSI's condition based on solar radiation and location are suitable for solar PV system installation. Before system installation, the GSA 2.3 web tool suggested that an energy output of 8.72 kWh/day can be generated from a 2.5 kWp solar PV system. This system can at least satisfy the ESCoBox's result of daily total average energy demand by EPLISSI of 4.6 kWh/day. As for the actual installation, the installed solar power capacity was 2.48 kWp (i.e., eight 310 W solar panels were used), together with 12 lead-acid batteries (i.e., 12 V, 100 Ah battery capacity). A 12-month worth of fieldwork data consisting of actual load demand, solar radiation, and wind speed were collected and used as inputs for the HOMER software. It was found that the existing installed system (i.e., termed as the first condition in the HOMER data analysis stage) in EPLISSI was not optimally designed, as a 14.3% capacity shortage exists. This PV system configuration also has a higher net present cost (NPC) and cost of electricity (COE) under the 15% maximum annual capacity shortage (MACS) limit. Using the actual electrical load demand and the on-site solar radiation data, the HOMER software suggested that an optimized system (second condition with 15% MACS) should consist of 5 kWp solar PV with 8 lead-acid batteries. This optimized system would be better in terms of the NPC (from RM 95836.15 to RM 91791.88, hence a reduction of 5.30%) and capacity shortage (from 14.3% to 13.5%, thus a reduction of 0.80%) compared to the existing system (first condition) in EPLISSI. Lastly, there exist 40% difference between the recommended PV capacity GSA 2.3, 2.5 kWp and HOMER, 1.5 kWp (in case of C2-SB). Smaller PV capacity is optimal for C2-SB system due to the incorporation of diesel generator (DG). This also result in lower NPC (from RM 95836.15 to RM 73918.00, hence a reduction of 22.87%) of the system.

## **ABSTRAK**

### **REKABENTUK DAN ANALISIS TENAGA SOLAR UNTUK ELEKTRIKASI LUAR BANDAR DI DESTINASI EKO-PELANCONGAN LIOGU KU SILOU-SILOU, EPLISSI, SABAH**

Malaysia telah menetapkan sasaran untuk mencapai 31% sumbangan sumber daripada jenis tenaga boleh diperbaharui menjelang 2025 untuk mencari sumber tenaga bersih bagi menjana elektrik. Namun, di Sabah dan Sarawak, lebih daripada 50% daripada penduduk berada di bawah paras kemiskinan setakat 2017. Bagi mengatasi masalah tersebut, penyelidikan ini berhasrat untuk membantu dalam mempromosikan teknologi tenaga boleh diperbaharui. Destinasi Eko-Pelancongan Liogu Ku Silou-Silou (EPLISSI), Kota Belud, Sabah telah dipilih sebagai tapak kajian. Manakala, objektif kajian ini adalah untuk membangunkan sistem solar fotovoltai (PV) tanpa grid yang berskala kecil, menganalisis prestasinya serta mencari reka bentuk yang paling optimum melalui kajian simulasi. Sementara itu, kaedah yang digunakan untuk mencapai matlamat penyelidikan ini termasuk kejian penilaian awal, pembangunan reka bentuk melalui kajian literatur serta pengiraan dan pemilihan komponen, fabrikasi dan pengujian komponen, dan pemasangan sistem dan alat pengukur. Bagi kajian simulasi pula, ia dibantu oleh perisian ESCoBox, Global Solar Atlas versi 2.3 (GSA 2.3), dan HOMER. Kedua-dua perisian ESCoBox dan GSA 2.3 telah digunakan dalam kajian penilaian awal (sebelum pemasangan sistem solar PV) untuk membantu dalam penjana profil beban dan untuk memilih saiz saiz sistem panel PV. Manakala perisian HOMER digunakan untuk melakukan pengoptimuman sistem (pasca pemasangan sistem solar PV) pada sistem sedia ada. Hasilnya, didapati bahawa keadaan EPLISSI berdasarkan penilaian sinaran matahari dan lokasi adalah sesuai untuk pemasangan sistem solar PV. Hasil daripada perisian GSA 2.3, sistem solar PV berkapasiti 2.5 kWp boleh menjana sehingga 8.72 kWj/hari. Kapasiti sistem ini dapat memenuhi jumlah purata permintaan tenaga harian sebanyak EPLISSI sebanyak 4.6 kWj/hari. Saiz panel solar sebenar yang direka dan dipasang ialah 2.48 kWp (lapan panel solar berkapasiti 310 W digunakan) bersama 12 bateri asid plumbum (12 V, 100 Ah). Memandangkan data kerja lapangan selama 12 bulan yang telah dikumpul kemudiannya digunakan sebagai input untuk perisian HOMER, ia didapati bahawa sistem pemasangan sedia ada (keadaan pertama) di EPLISSI tidak direka bentuk secara optimum kerana terdapat kekurangan kapasiti sebanyak 14.3%. Konfigurasi sistem PV ini juga mempunyai kos semasa bersih (NPC) dan kos elektrik (COE) yang lebih tinggi di bawah 15% had kekurangan kapasiti tahunan maksimum (MACS). Dengan menggunakan beban elektrik sebenar dan data sinaran suria di tapak pemasangan, perisian HOMER mencadangkan bahawa sistem optimum (keadaan kedua dengan 15% MACS) terdiri daripada PV solar 5 kWp dengan 8 bateri asid plumbum. Sistem yang dioptimumkan ini adalah lebih baik dari segi NPC (dari RM 95836.15 kepada RM 91791.88, iaitu pengurangan sebanyak 5.30%) dan kekurangan kapasiti (daripada 14.3% kepada 13.5%, juga pengurangan sebanyak 0.80%). Akhir sekali, terdapat perbezaan 40% antara kapasiti PV yang disyorkan oleh GSA 2.3, 2.5 kWp dan HOMER, 1.5 kWp (dalam kes C2-SB). Kapasiti PV optimum yang lebih kecil terhasil bagi sistem C2-SB kerana penggabungan penjana diesel (DG). Ini juga menyebabkan NPC yang lebih rendah (daripada RM 95836.15 kepada RM 73918.00, oleh itu pengurangan sebanyak 22.87%).

## LIST OF SYMBOLS

<b>A</b>	-	Area of a circle
<b>R</b>	-	Radius of a circle
<b><i>Q<sub>solar</sub></i></b>	-	Solar power
<b><i>I<sub>sc</sub></i></b>	-	Solar constant
<b><math>\beta_{opt}</math></b>	-	Optimum tilt angle
<b><math>\delta</math></b>	-	Declination Angle
<b><i>N</i></b>	-	Day number of year
<b><i>L</i></b>	-	Latitude
<b><i>Long</i></b>	-	Longitude
<b><i>h</i></b>	-	Hour angle
<b><i>I<sub>tot</sub></i></b>	-	Total solar irradiance
<b><b>I<sub>D</sub></b></b>	-	Direct irradiance
<b><b>I<sub>DN</sub></b></b>	-	Direct normal irradiance
<b><b>I<sub>S</sub></b></b>	-	Diffuse irradiance or sky radiation
<b><b>I<sub>R</sub></b></b>	-	Reflected irradiance
<b><i>p/p<sub>o</sub></i></b>	-	Atmospheric pressure relative to a standard atmosphere
<b><b>z</b></b>	-	Elevation
<b><b>A</b></b>	-	Apparent solar irradiation or apparent extra-terrestrial solar intensity
<b><b>B</b></b>	-	Atmospheric extinction coefficient
<b><b>C</b></b>	-	Ratio of diffuse radiation on a horizontal surface to direct normal irradiation
<b><math>\rho</math></b>	-	Foreground reflectivity
<b><b>H</b></b>	-	Insolation
<b><i>E<sub>solar</sub></i></b>	-	Total solar energy
<b><b>A<sub>collector</sub></b></b>	-	Surface area of a collector
<b><i>E<sub>elect</sub></i></b>	-	Total electrical energy
<b><math>\eta_{cell}</math></b>	-	Solar cell efficiency
<b><math>\Omega</math></b>	-	Ohm (internal resistance unit)
<b><b>DIF</b></b>	-	Ratio of the average daily diffuse radiation on a tilted surface to that on a horizontal surface
<b><math>\beta_1</math></b>	-	Solar altitude angle
<b><math>\beta_2</math></b>	-	Collector or module tilt angle
<b><math>\alpha_1</math></b>	-	Solar azimuth angle
<b><math>\alpha_2</math></b>	-	Azimuth angle of the normal to the collector surface
<b><math>\theta</math></b>	-	Collector angle
<b><math>\alpha</math></b>	-	Ground surface friction coefficient
<b><i>V<sub>1</sub></i></b>	-	Measured wind speed
<b><i>V<sub>2</sub></i></b>	-	Wind speed calculated at the reference height
<b><i>h<sub>1</sub></i></b>	-	Height
<b><i>h<sub>2</sub></i></b>	-	Reference height
<b><i>C<sub>ann,tot</sub></i></b>	-	Total annualised cost
<b><i>C<sub>boiler</sub></i></b>	-	Boiler marginal cost
<b><i>H<sub>served</sub></i></b>	-	Total thermal load served

- $E_{served}$  - Total electrical load served
- $f_{ren}$  - Renewable fraction
- $E_{nonren}$  - Non-renewable electrical production
- $H_{nonren}$  - Non-renewable thermal production

## LIST OF ABBREVIATIONS

<b>EPLISSI</b>	-	Eco-Tourism Destination of Liogu Ku Silou-Silou
<b>AST</b>	-	Apparent solar time
<b>LST</b>	-	Local standard time
<b>LSTM</b>	-	Local standard time meridian
<b>ET</b>	-	Equation of time
<b>BOS</b>	-	Balance of System
<b>SP</b>	-	Solar Panel
<b>BSS</b>	-	Battery Storage System
<b>SCC</b>	-	Solar Charge Controller
<b>INV</b>	-	Inverter
<b>HIC</b>	-	Hybrid Inverter Charger
<b>PV</b>	-	Photovoltaic
<b>SPV</b>	-	Solar Photovoltaic
<b>DG</b>	-	Diesel Generator
<b>WT</b>	-	Wind Turbine
<b>Batt</b>	-	Battery
<b>Conv</b>	-	Converter
<b>C1</b>	-	Configuration 1
<b>C2</b>	-	Configuration 2
<b>C3</b>	-	Configuration 3
<b>SA</b>	-	Scenario A
<b>SB</b>	-	Scenario B
<b>F</b>	-	Fieldwork
<b>H</b>	-	Homer
<b>COE</b>	-	Cost of Electricity
<b>NPC</b>	-	Net Present Cost
<b>MACS</b>	-	Maximum Allowable Capacity Shortage
<b>Mono-Si</b>	-	Monocrystalline
<b>Poly-Si</b>	-	Polycrystalline
<b>TFSC</b>	-	Thin-Film Solar Cell
<b>A-Si</b>	-	Amorphous Silicon
<b>CdTe</b>	-	Cadmium Telluride
<b>CVP</b>	-	Concentrated PV
<b>HCVF</b>	-	High Concentrated PV
<b>MC4</b>	-	Multi-Contact, 4 millimetres
<b>DNI</b>	-	Direct Normal Irradiance
<b>DHI</b>	-	Diffuse Horizontal Irradiance
<b>GHI</b>	-	Global Horizontal Irradiance
<b>DOD</b>	-	Depth of Discharge
<b>SOC</b>	-	State of Charge
<b>ROI</b>	-	Return of Investment
<b>IRR</b>	-	Internal Rate of Return
<b>CSR</b>	-	Corporate Social Responsibility
<b>RE</b>	-	Renewable Energy
<b>RMSD</b>	-	Root-Mean-Square Deviation

## LIST OF APPENDICES

	Page
Appendix A : The Front Page of The Questionnaire Form	214
Appendix B : Project Logo	215
Appendix C : The Format Dimension of The Solar Panel	216
Appendix D : The Design of Solar Panel Support	217
Appendix E : The Outsourced Drawing of The Solar Panel Support	218
Appendix F : The Quotation of The Material for The Outsourced Solar Panel Mounting	219
Appendix G : The Datasheet of The Hanwha Qcells Q.Peak Duo-G7 310-320	220
Appendix H : Epever Upower Series Hybrid Inverter Charger Datasheet	222
Appendix I : Recalibration Order of The Acksen Devices (1-year warranty of calibration)	224
Appendix J : Bluesun Solar Battery FCD12-100 Datasheet	225
Appendix K : VRLA Battery Instruction Manual	227
Appendix L : The Drawing of The Battery Rack	229
Appendix M : EPLISSI Business Card	233
Appendix N : Acksen Electroorder DC-3VA Datasheet (Acksen, no yr.-b)	234
Appendix O : Acksen Electroorder CT-2VA Datasheet (Acksen, no yr.-a)	236
Appendix P : Delta OHM (Italy) AWS of model HDMCS -200 Datasheet (Delta OHM, no yr.)	238
Appendix Q : Schematic Diagram of The Off-Grid Solar PV System	240
Appendix R : PEREKA UMS 2020 Certification of Award	241
Appendix S : MDPI, Sustainability Article (Matius et al., 2021)	242
Appendix T : Tech Science Press, Energy Engineering Article (Matius et al., 2022)	243
Appendix U : Proof of Conference Attendance	244

# CHAPTER 1

## INTRODUCTION

### 1.1 Introduction

In terms of a country's development, the electricity use rate could signify how well-developed the country is (Seshie et al., 2018; United States Energy Information Administration, 2017). However, it is not applied to the Organization for Economic Cooperation and Development (OECD) countries (i.e., the United States, Japan, and the United Kingdom), focusing on service economies rather than manufacturing economies (United States Energy Information Administration, 2017). According to International Energy Agency (2017), the global demand for electricity in 2018 rose by 4%. It has been at its fastest pace since 2010. For the power generation system to meet the rising electrical demand, the primary sources, such as coal and natural gas, represent nearly 60% of the global electricity supply (International Energy Agency, 2020).

However, researchers from all over the world are putting in continuous efforts to develop renewable energy (RE) technology. It is an effort to discover a worthy substitute for fossil fuels. They are the world's most significant culprit of triggering global warming and responsible for causing a high uncertainty of alarming climate (Shahzad, 2015). It can be implied that renewable technologies are here to stay and expand even more through various uses of RE technologies and judging from the current capability of this type of energy source, as stated by Gielen et al. (2019). A higher adoption rate will reduce the cost of owning these technologies (International Energy Agency, 2017). Soon, there is no doubt that RE technology will be the primary source of electricity, offering hope for a cleaner and better environment.
